PROFESSIONAL SUMMARY

AI Product Engineer building production AI products and supporting infrastructure. Lead engineering and customer experience improvements for FlightHub's Mila Voice, spanning voice-agent architecture, AI-driven end-to-end testing, evaluations, and product experiments.

EXPERIENCE

Full Stack Developer | FlightHub

Solutions team | Montreal, QC | Dec 2022 - Present

Mila Voice | Customer Support AI Agent

- Lead engineering for Mila Voice as its only assigned engineer, partnering with a QA/PM. The agent handled 58,946 inbound customer service calls in August 2026, or 88.12% of that month's inbound service calls.
- Refactored the voice-agent system and migrated it from the older real-time voice system to the GPT Live API, including existing silence-detection and customer re-engagement safeguards.
- Built an AI-driven end-to-end testing workflow that uses GPT Live to act as a customer in repeated calls with development versions of Mila Voice, validating fixes alongside regression evaluations.
- Run GrowthBook experiments and monitor production behaviour to measure product changes and guide customer-experience improvements with the QA/PM.

Company-wide Email & SMS Infrastructure

- Designed and implemented the email engine and introduced the company's SMS service, combining scalable email rendering, reliable data retrieval, and resilient, observable job processing. The APIs sent 1,774,190 emails and 269,308 SMS messages in August 2026.
- Before focusing on Mila Voice, worked directly with the CEO and COO to solve technical challenges across the company's stack, spanning customer-facing applications, internal tools, and third-party integrations.

PROJECTS

CoachDiff | AI-powered League of Legends coaching

coachdiff.com

- Built an AI coaching system that turns over 60 million tokens of raw match telemetry into timestamped feedback linked to replay evidence. Combined computer vision models, HUD analysis, and game APIs into synchronized game states.
- Designed and benchmarked eight compact telemetry formats, reducing LLM input tokens by 67% versus raw input in a repeated benchmark. Evaluated whether formats retained important coaching decisions in targeted tests.
- Implemented sequential, minute-by-minute analysis with a persistent factual ledger, structured output validation, and checkpoint recovery, followed by synthesis into a complete game review.

TECHNICAL SKILLS

AI engineering: Voice agents, LLM evaluations, AI-driven end-to-end testing, context engineering, structured outputs, GrowthBook experiments

Development: Python, TypeScript, JavaScript, React, FastAPI, Node.js, REST APIs

Infrastructure: PostgreSQL, Redis, Docker, Cloudflare Workers, Twilio, asynchronous job processing

EDUCATION

Diploma of College Studies (DEC), Computer Science & Technology | Vanier College | 2021
